Small Power Transformers are distribution transformers from 5 to 40 MVA with a maximum service voltage of 145 kV. They are typically used as network transformers in distribution networks. These types of transformers are normally 3-phase application and are designed according to international standards such as IEC 60076. Normally, the cooling types of Small Power Transformers are ONAN (oil-natural, air-natural) or ONAF (oil-natural, air-forced). Tapping can be designed both with off-circuit or on-load tap changers.
