Special Transformer

Mobile transformers are used in mobile substations. These substations are used in emergency situations or as temporary solutions for the supply of electric power. Mobile transformers are very compact due to their function. These types of transformers are normally 3-phase and are designed according to international standards such as IEC 60076. Normally, the cooling types of Mobile Transformers are ONAN (oil-natural, air-natural) , ONAF (oil-natural, air-forced) or OFAF (oil-forced, air-forced). Tapping can be designed with off-circuit or on-load tap changers.
